

# Evaluation of the crome EV-Fleet

Barcelona, November 19<sup>th</sup>, 2013

Patrick Jochem

FRENCH-GERMAN INSTITUTE FOR ENVIRONMENTAL RESEARCH (DFIU)  
Chair of Energy Economics (Prof. Dr. W. Fichtner)

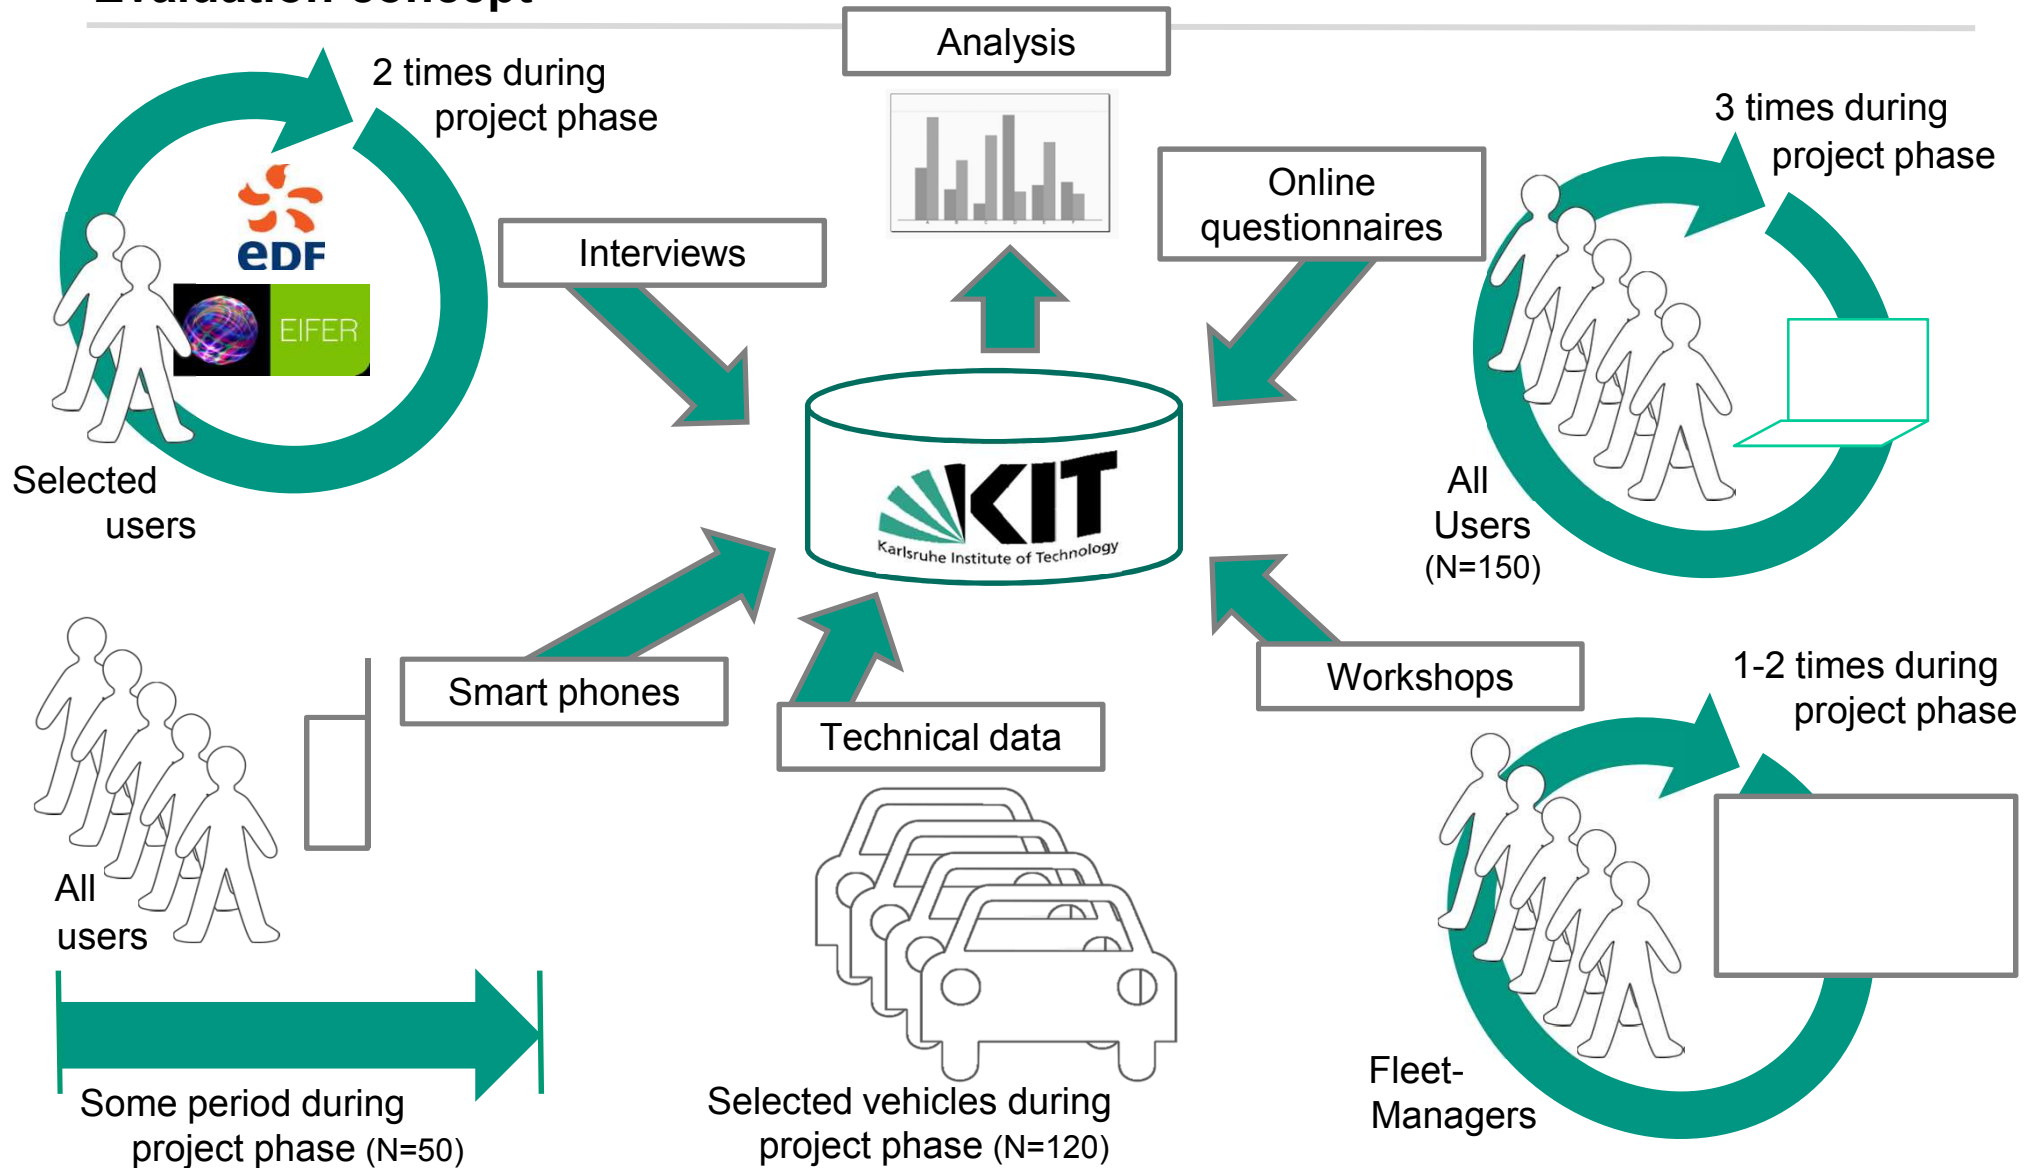

## Agenda

---

- **General evaluation concept**
- **Specific results from different research disciplines**
  - ✓ acceptance analysis from online questionnaires
  - ✓ fast charging EVSE and its impact on the local grid
  - ✓ tracking of EV by CAN bus data and data from smart phones
  - ✓ applied services
  - ✓ European (energy) law
- **Conclusions**

# Evaluation concept

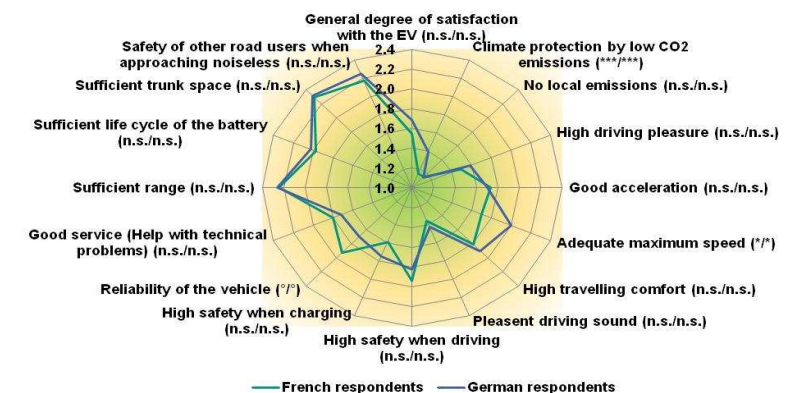

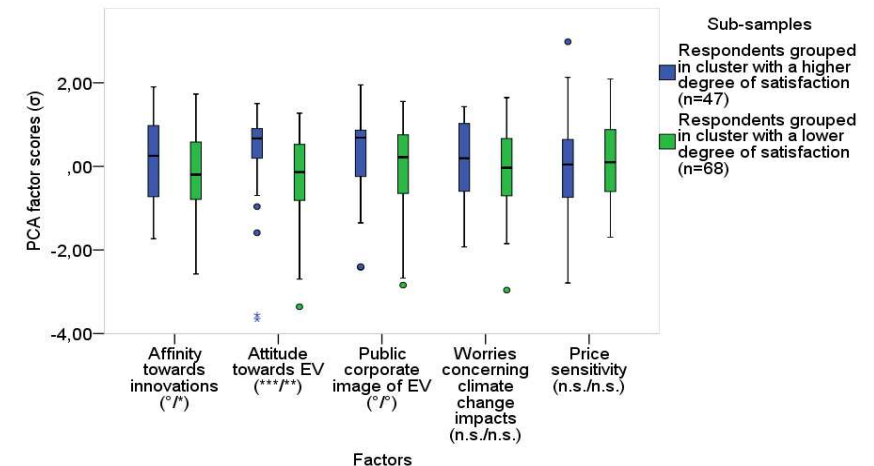

# Acceptance analysis from online questionnaires

## Methodology

- **Three online questionnaires**
  - ✓ Expectations
  - ✓ First Experiences
  - ✓ Recommendations
- **Application of different statistical methods** (e.g. descriptive analysis, PCA)

## ■ Main Results:

- ✓ **High satisfaction with EV**  
(advantages: e.g. local emissions, acceleration, CO<sub>2</sub> emissions; concerns: e.g. range, life cycle of battery)
- ✓ **Differences in beliefs** (e.g. worries concerning climate change)

Presentation: Axel Ensslen, Session 8DTomorrow at 10:35

# Fast charging EVSE in the local grid (1)

Demonstrator at KIT

## Real-time load flow calculation

Load flow calculation

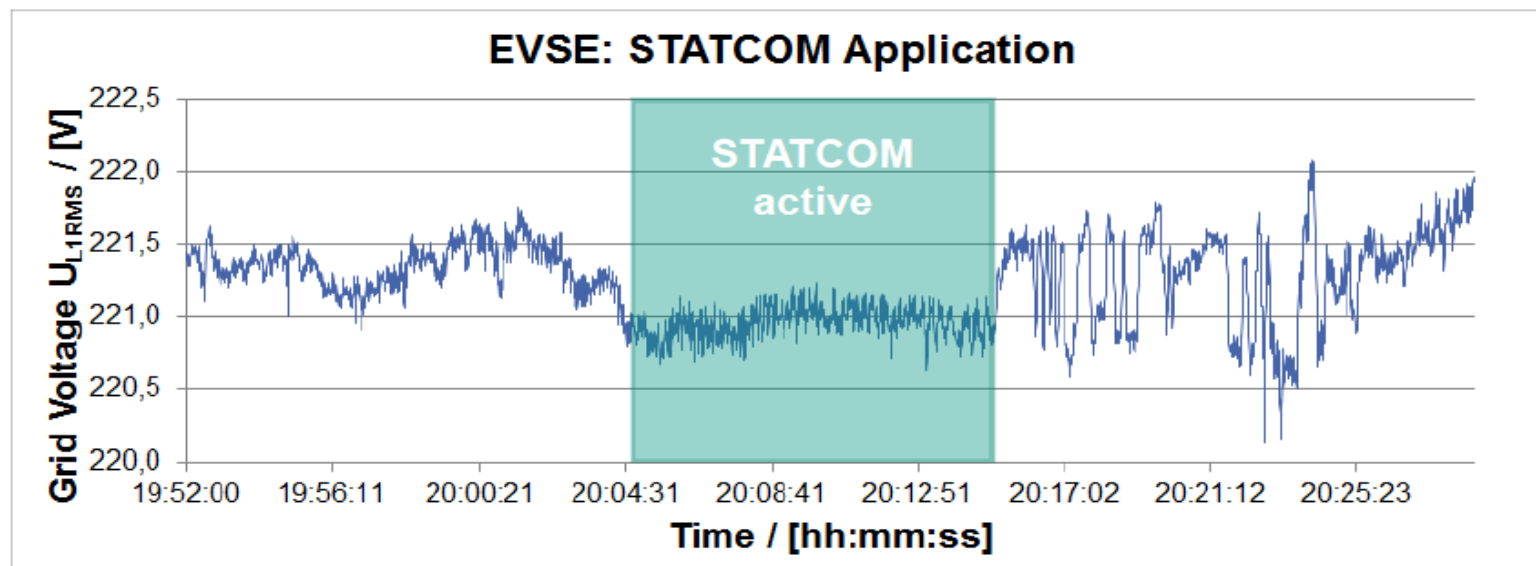

Network simulator

## Fast charging EVSE Demonstrator

## Fast charging EVSE in the local grid (2)

- The impact on the local grid could be significant.
- The recommendation is to include technical components in the EVSE for grid services (at least in some).
- Reactive power compensation is not only favorable for the EVSE, but also for the local grid environment (e.g. photovoltaic systems).

## Tracking of vehicle data (1)

- Smart phones are used as mobile data loggers in EV.
- Approx. 50 EVs in France and Germany have been equipped.
- Data from data loggers in EV are received from Daimler, Porsche, PSA and Renault.
- Comprehensive data sample (e.g. mileage, driving times, speed, trip purpose):

The image shows a Samsung smartphone displaying the KIT CROME app interface. The screen shows a survey form with the following questions and options:

- Wie ist der Fahrtzweck:
- Ist ein Grenzübertritt geplant?
- Welche weiteren Verkehrsmittel werden für den Weg eingesetzt:

Below the form are buttons for 'Zurück' and 'Weiter'.

To the right is a screenshot of the app's data entry screen, showing the following fields:

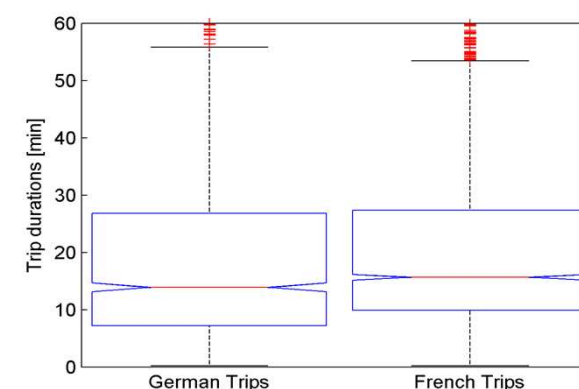

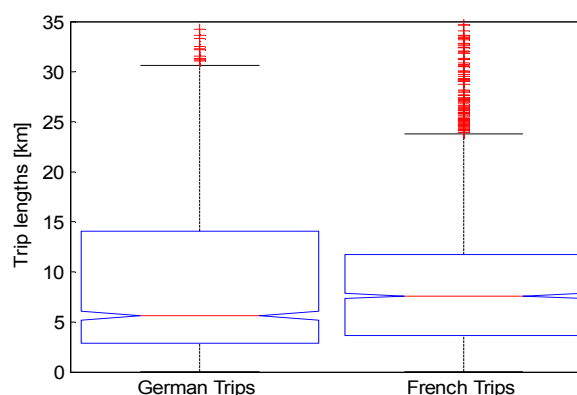

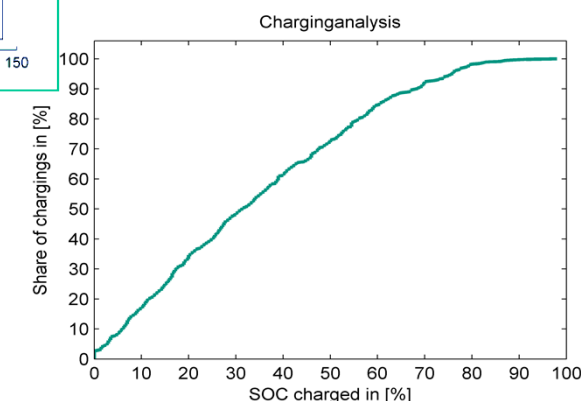

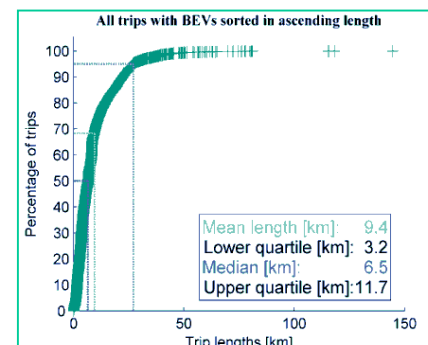

- Anzahl Erwachsene im Fahrzeug:
- Anzahl Minderjährige im Fahrzeug:
- Wieviel Gepäck wird mitgeführt:

At the bottom are buttons for 'Zurück' and 'Los!'.

	Car	Smart phones	Sum
Number of trips	80,660	6,500	<b>87,160</b>
Cross-border share in %	0.01%	1.4	<b>0.8</b>
Number of chargings	16,080	n/a	<b>16,080</b>

## Tracking of vehicle data (2)

- Most trips are shorter than those of ICE business cars.
- Batteries are mostly used at high SOC values with small delta (80% of trips use less than 10% SOC).
- French trips are significantly longer.
- German trips show bigger length variation.
- Trip duration is similar.
- More urban use in Germany.

Poster: Matthias Pfriem, dialoge session today at 1 p.m.

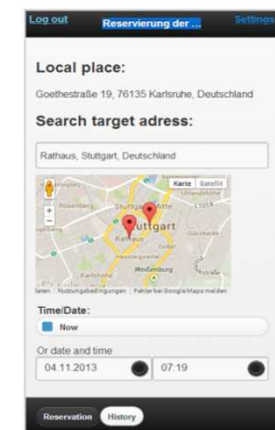

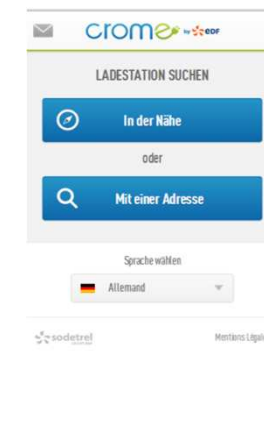

## Services in CROME

### Services at the EVSE

### Services for smart phones

### Services for the EV

### Definition of basic and advanced services

## European (Energy) Law

---

- National Energy Law is based on European provisions (2009/72/EC).
- For now no specific regulations concerning EVSE.
- EU is planning a new directive COM 2013(18) final.
  - ✓ Minimum number of charging stations (GER 1503k FRA 969k)
  - ✓ Standardization for plugs (Type 2 and suggestion for CCS)
  - ✓ Regulation exception for the charging station provider
  - ✓ Charging stations have to implement smart meter technology
  - ✓ ...

→ Further harmonization of European legislation required.

## Conclusions

---

- Fleet evaluation concept consists of a multi-disciplinary approach
  - ✓ acceptance analysis from online questionnaires
  - ✓ fast charging EVSE and its impact on the local grid
  - ✓ tracking of EV with CAN bus data and data from smart phones
  - ✓ applied services
  - ✓ European (energy) law

# USER EXPERIENCE

---

# Conclusion

- **A unique wide-scale cross-border field demonstration of e –mobility**
- **Fully interoperable charging stations with easy access and charging of all EVS over the Crome area**
- **An assesment based on a wide diversity of new generation EVs, of charging conditions and mode, of standards and of customers (B2B, B2C, fleets, ...)**
- **Customer-oriented charging services :**
  - Simplified identification and billing
  - Availability of the charging spots and reservation (investigated)
  - Access to all charging spots within CROME area
  - Roaming of e-mobility services between infrastructure operators
- **Test and recommendation on charging infrastructures and services to European standardisation**
